

From churn model to a reliable retention service

A working system for predicting churn, selecting retention actions and improving decisions over time.

DELIVERED OUTCOMES

- Ready to use
- Monitored
- Recoverable

CONTROLLED BUSINESS SCENARIO

A controlled change in churn outcomes simulates evolving customer behavior. Adaptive retraining is compared with a static policy over the same observations.

+2.7%

post-drift F1 versus the static policy

+€84

simulated value uplift over the final 16 days

VERIFIED

safe updates, recovery and cloud storage

CLIENT RISK

Churn scores alone do not create value. Untargeted retention actions waste budget, while unmonitored models can degrade as customer behavior changes.

ENGINEERED RESPONSE

Decision thresholds combine churn risk, customer value and intervention costs. New candidates are promoted only when they pass policy and release checks.
